

Erdbebenliste

Die folgende Liste führt sämtliche im Bereich Basel vom Schweizerischen Erdbebendienst aufgezeichneten und lokalisierten Erdbeben seit dem Beginn der Injektion von Wasser in das Bohrloch auf.

Automatische Lokalisierungen sind durch ein A gekennzeichnet, [manuelle durch ein M](#). Automatische Lokalisierungen werden überschrieben, sobald eine manuelle Auswertung durch einen Seismologen oder eine Seismologin vorliegt. Die Liste wird fortlaufend aktualisiert. Sämtliche Erdbeben sind auch auf unterschiedlichen [Erdbebenkarten](#) dargestellt. Sie erhalten zusätzliche Informationen, wenn Sie auf das Ereignis in der unten aufgeführten Liste klicken. Unten finden Sie weitere Informationen zu den [Magnituden](#) und eine [Legende](#) für die Tabelle (Nutzer des *Microsoft Internet Explorer*: bitte nach unten scrollen).

http://www.seismo.ethz.ch/redpuma/redpuma_swiss_list.html enthält Angaben, wie folgt:

A = Automatischer Wert; **M** = hernach manuell eingesetzter Wert (Mischwert)

Local time: unsere BS-Lokalzeit ist plus 1 Stunde von Time (UTC)(= 1 Std weniger als in Basel)

Tabellenlegende

Die einzelnen Spalten der Tabelle enthalten folgende Informationen:

pga/pgv	Link zu den Erschütterungskarten
Seismogr.	Link zu den Seismogrammen
Datum	Tag, an dem das Erdbeben aufgetreten ist (Jahr-Monat-Tag)
Zeit	Uhrzeit, zu der das Beben aufgetreten ist (24 Stunden-Anzeige). Die Angabe ist in UTC (Universal Time Coordinated). Die entsprechende Lokalzeit erhält man, wenn man zur UTC eine Stunde (Winterzeit) bzw. zwei Stunden (Sommerzeit) hinzuzählt.
Breite	Geographische Breite, an der das Beben aufgetreten ist (in Dezimalgrad Nord)
Länge	Geographische Länge, an der das Beben aufgetreten ist (in Dezimalgrad Ost) Latitude und Longitude bestimmen somit die Lage des Erdbebens an der Erdoberfläche (Epizentrum).
Tiefe	Tiefe des Erdbebenherdes (Hypozenrum) in Kilometer
Magnitude (ML)	Lokale Magnitude (Richterskala)
LT	Auswertungstyp (location type): A: automatisch; M: manuell
Region	Gebiet, in dem das Erdbeben auftreten ist. In der Regel Angabe eines Kartenblattes der Schweiz (1:25,000); ausserhalb des Schweizer Kartensatzes: Deutschland oder Frankreich

Abweichungen der Magnituden: Die Erdbeben in Basel werden nicht nur vom Schweizerischen Erdbebendienst (SED), sondern u.a. auch vom deutschen Landeserdbebendienst (LED) und den beiden französischen Erdbebendiensten Laboratoire de Détection Géophysique (LDG) und Réseau National de Surveillance Sismique (RéNaSS) aufgezeichnet. Die Institute lokalisieren die Erdbeben und weisen ihnen eine Stärke zu, die sogenannte **lokale** Magnitude (ML). Beim Besuch der Webseiten der einzelnen Erdbebendienste wird dem Beobachter auffallen, dass die **Magnitudenangabe für das gleiche Beben bei den unterschiedlichen Erdbebendiensten** leicht voneinander abweichen können. Die Magnituden des LDG liegen im Schnitt **um 0.5, die** von RéNaSS um 0.4 und die des LED um 0.2-0.3 über den Werten des SED. Diese Unterschiede sind generell nicht vermeidbar und liegen in der Methodik der Magnitudenberechnung begründet.

Folgende Parameter beeinflussen die Magnitudenbestimmung:

- **Anzahl und der Ort** der für eine Lokalisierung verwendeten Stationen – diese **variieren** pro Beben und Erdbebendienst;
- **die Beschaffenheit des von den Erdbebenwellen** durchlaufenden **geologischen Untergrund** – dieser ist jedoch **nur begrenzt bekannt**; sowie
- **die mathematische Formel, mit der die Magnitude berechnet** wird – sie ist **nicht** bei **allen** Erdbebendiensten **die gleiche**.

Die Angabe der Magnitude ist von daher mit gewissen Unsicherheiten (Fehlern) behaftet, welche jedoch in etwa im Bereich der natürlicherweise vorhandenen Unsicherheiten der Magnitudenangaben liegen. Aus Gründen der Vergleichbarkeit mit früheren Beben in der Schweiz sind die Magnituden des SED für die seismische Überwachung des DHM-Projektes massgebend.

Kategorie: General

Erdbeben vom 02.02.2007

Am [02.02.2007 um 04:54 Basel-Ortszeit](#) registrierte der Schweizerische Erdbebendienst **1** Erdbeben in Basel mit [der Stärke MI=3.3](#) (lokale Richter Magnitude). Das Beben dürfte deutlich an der Erdoberfläche verspürt worden sein. Schäden sind nicht zu erwarten. Das... Epizentrum befindet sich in unmittelbarer Nähe zum Bohrloch des "Deep Heat Mining" Projektes in Basel. Das Beben ist also nach jetzigem Wissenstand eine Folge der im Dezember durchgeführten Injektion.

Erdbeben vom 16.01.2007

sedbasel | 16 Januar, 2007 00:09:13 (UTC time)

Am [16.01.2007 um 01:09h \(Ortszeit Basel\)](#) registrierte der Schweizerische Erdbebendienst **1** Erdbeben in Basel mit [der Stärke MI=3.2](#) (lokale Richter Magnitude). Das Beben dürfte deutlich an der Erdoberfläche verspürt worden sein. Schäden sind nicht zu erwarten. Das Epizentrum befindet sich in unmittelbarer Nähe zum Bohrloch des "Deep Heat Mining" Projektes in Basel. Das Beben ist also nach jetzigem Wissenstand eine Folge der im Dezember durchgeführten Injektion.

Erdbeben vom 06.01.2007

sedbasel | 06 Januar, 2007 07:19:25 UTC

Am [06.01.2007 um 08:19h](#) (Basler Ortszeit 07:19:25h UTC) registrierte der Schweizerische Erdbebendienst **1** Erdbeben in Basel mit der [Stärke MI=3.1 \(lokale Richter Magnitude\)](#). Das Beben dürfte deutlich an der Erdoberfläche verspürt worden sein. Schäden sind nicht zu erwarten. Das Epizentrum befindet sich in unmittelbarer Nähe zum Bohrloch des "Deep Heat Mining" Projektes in Basel. Das Beben ist also nach jetzigem Wissenstand eine Folge der im Dezember durchgeführten Injektion.

Seismizitaet, 22. Dezember 2006 bis 3. Januar 2007

sedbasel | 03 Januar, 2007 14:50

Im Zeitraum 22. Dezember 2006 bis 3. Januar 2007 haben sich 3 Erdbeben in der Umgebung des Bohrlochs ereignet mit Magnituden zwischen 0.5 und 1.3. Dass es trotz Ende der

Wassereinjektion noch zu Erdbeben kommt liegt daran, dass sich noch Wasser im Untergrund befindet, welches sich langsam verteilt. Die Aktivitaet sollte aber weiterhin abnehmend sein. Es kann jedoch nicht ausgeschlossen werden, dass auch noch Ereignisse auftreten, die verspuert werden koennen.

Seismizitaet, 15.-21. Dezember 2006 (14:00)

sedbasel | 21 Dezember, 2006 13:31

Im Zeitraum 15.-21. Dezember haben sich

3 Erdbeben in der Umgebung des Bohrlochs ereignet:

19.12.2006: M=1.1 und M=1.8.

21.12.2006: M=1.4.

Dass es trotz Ende der Wassereinjektion noch zu Erdbeben kommt liegt daran, dass sich noch Wasser im Untergrund befindet, welches sich langsam verteilt. Die Aktivitaet sollte aber weiterhin abnehmend sein. Es kann jedoch nicht ausgeschlossen werden, dass auch noch Ereignisse auftreten, die verspuert werden koennen.

Beben vom 14.12.2006

sedbasel | 15 Dezember, 2006 02:58

Am Donnerstag, 14.12.2006, um 23:39 Lokalzeit hat der SED

1 Beben der **Magnitude 2.5** in der Umgebung des Bohrlochs registriert.

Aktuelle Seismizitaet

sedbasel | 14 Dezember, 2006 08:07

Die Seismizitaet in Basel ist sehr stark zurueckgegangen. Gegenwaertig registriert der SED ca. 1-2 Beben pro Tag mit Magnituden um 1.

Seismizitaet, Dienstag 12.12.2006

sedbasel | 12 Dezember, 2006 18:36

In den letzten 24 Stunden hat der Schweizerische Erdbebendienst ein Beben mit der Magnitude 1.2 in der Umgebung des Bohrlochs registriert.

Seismizitaet, Montag 11.12.2006

sedbasel | 11 Dezember, 2006 21:57

In den letzten 27 Stunden hat der Schweizerische Erdbebendienst keine Erdbeben mehr in Basel registriert.

Seismizitaet, Sonntag 10.12.2006

sedbasel | 10 Dezember, 2006 21:03

Im Vergleich zu den Vortagen nimmt die Seismizitaetsrate weiterhin ab. Die Magnituden der vom Schweizerischen Erdbebendienst registrierten Beben lagen in den letzten [24 Stunden zwischen 0.9 und 1.9](#).

Seismizitaet Samstag, 9.12.2006

sedbasel | 09 Dezember, 2006 21:38

Seit gestern Abend nimmt die Seismizitaetsrate um das Bohrloch herum in Kleinhüningen stetig ab und die durchschnittliche Magnitude sowie die Maximalamplituden werden kleiner. In den letzten 24 Stunden lag die grösste Magnitude nur noch bei 1.8.

Seismizitaet 5.12.2006 bis 8.12.2006 (24:00 Uhr)

sedbasel | 08 Dezember, 2006 23:55

Seit Dienstag Abend sind 72 Erdbeben um das Bohrloch herum in Kleinhüningen aufgetreten. Davon **hatten**

7 Erdbeben eine [Magnitude zwischen 2 und 3](#).

1 Erdbeben hatte die [Magnitude 3.4](#) und wurde in der Region Basel verspürt. Schäden sind bei diesen Magnituden nicht zu erwarten.

Seismizitaet 2.12.2006 bis 5.12.2006 (18:00 Uhr)

sedbasel | 05 Dezember, 2006 17:58

Seit Beginn der Stimulation am 2.12.2006 hat der Schweizerische Erdbebendienst **17 Mikroben** in Basel in der Umgebung des Bohrlochs registriert. Die Magnitudenverteilung verhaelt sich wie folgt (Magnituden werden als Lokalmagnitude ML angegeben):

3 Erdbeben mit Magnituden **kleiner** als 1.0.

14 Erdbeben mit Magnituden **zwischen** 1.0 und 1.7.

Die Magnituden haben einen Fehler von ± 0.3 . Die Verteilung der Erdbeben entspricht unseren Erwartungen, sowohl bezueglich der Magnituden als auch der geographischen Anordnung (siehe auch unsere Seite *Projekt -> Hintergrund*).

Beginn Stimulation

sedbasel | 02 Dezember, 2006 20:25

Am Samstag, 2. Dezember 2006, hat die Stimulation begonnen. Seit 19:15 Uhr wird durch das Bohrloch in Kleinhueningen Wasser in den Untergrund gepumpt.

Beginn der Vorstimulation

sedbasel | 25 November, 2006 17:10

Freitag, 24. November 2006, wurde um 20 Uhr in Basel mit der Vorstimulation des Untergrundes begonnen. Diese dauert ca. 24 Stunden. Dabei werden geringe Wassermengen (1 bis max 6 liter/min) unter geringem Druck in das Bohrloch gepumpt. Die Vorstimulation dient nicht dazu, dass Gestein bereits mit Hilfe des Wassers staerker zu zerklueften, sondern lediglich dazu, sich ein Bild von dem Grad der natuerlichen Permeabilitaet des Gesteins zu machen. Die Wassermengen und der Druck sind dementsprechend bewusst sehr klein gewaehlt. Die Induzierung von Mikroeben zu diesem Zeitpunkt ist daher eher unwahrscheinlich.
